Single-Cell Genomics Data Processing Training Course

Introduction

Single-cell genomics has emerged as a revolutionary field in molecular biology and biomedical research, providing unprecedented resolution to explore cellular heterogeneity. Unlike traditional bulk sequencing methods that average gene expression across millions of cells, single-cell analysis captures the unique molecular profile of individual cells, revealing rare cell populations, transient cell states, and complex developmental trajectories. This shift from population-level to single-cell-level analysis is fundamentally transforming our understanding of health and disease, from cancer biology and immunology to neurodegenerative disorders. The sheer volume and complexity of the resulting datasets, however, pose significant computational and bioinformatics challenges, making proficiency in data processing and analysis an essential skill for modern life scientists.

Single-Cell Genomics Data Processing Training Course is designed to empower researchers, clinicians, and data scientists with the foundational and advanced skills necessary to navigate the single-cell genomics data landscape. Through a blend of theoretical lectures, hands-on practical sessions, and real-world case studies, participants will learn the complete single-cell RNA-seq (scRNA-seq) workflow, from raw data to biological insights. The curriculum focuses on cutting-edge bioinformatics tools, computational methods, and best practices for data quality control, normalization, dimensionality reduction, and cell clustering. By the end of this course, you will be equipped to independently perform complex single-cell data analyses, interpret results, and contribute to groundbreaking discoveries in your field.
